

Title:- Load and display JSON data using fetch() and jQuery \$.getJSON(); render results dynamically in a table.

Software/Tools Required

- **HTML5** – To create the structure of the webpage and table.
- **CSS3** – To design and style the webpage.
- **JavaScript** – To load JSON data using the fetch() API and dynamically generate table rows.
- **jQuery 3.7.1** – To load JSON data using \$.getJSON().
- **JSON** – To store the student data in structured format.
- **Visual Studio Code** – To write and manage the project files.
- **Web Browser** – To execute and test the application.
- **Live Server** – To run the HTML project through a local web server.

Theory

JSON (JavaScript Object Notation) is a lightweight data-interchange format commonly used to store and exchange structured data between a client and a server. JSON represents data using objects and arrays, making it easy for JavaScript applications to process.

The **fetch() API** is a modern JavaScript method used to make HTTP requests and retrieve resources such as JSON files. The response can be converted into a JavaScript object using the response.json() method.

jQuery \$.getJSON() is a jQuery method specifically designed to retrieve JSON data asynchronously. It provides a simple way to request a JSON file and execute a callback function when the data is successfully received.

After retrieving the JSON data, **JavaScript dynamically creates table rows** using DOM manipulation. The values such as ID, Name, Course, and Marks are inserted into the HTML table without manually writing each row.

In this experiment, two buttons are provided: one loads data using **fetch()**, while the other loads data using **jQuery \$.getJSON()**. Both methods demonstrate asynchronous JSON data retrieval and dynamic rendering of results.

SYMBIOSIS INSTITUTE OF TECHNOLOGY, NAGPUR

Symbiosis International (Deemed University)

(Established under section 3 of the UGC Act, 1956)

CHHATRAPATI SUPARE

Experiment-5

Student Data

Load JSON Data using fetch() and jQuery \$.getJSON()

Load using fetch()

Load using \$.getJSON()

ID	Name	Course	Marks
1	Rahul	B.Tech CSE	85
2	Amit	B.Tech IT	78
3	Sneha	B.Tech AI	92

Created by Chhatrapati Supare

Student Data

Load JSON Data using fetch() and jQuery \$.getJSON()

Load using fetch()

Load using \$.getJSON()

ID	Name	Course	Marks
1	Rahul	B.Tech CSE	85
2	Amit	B.Tech IT	78
3	Sneha	B.Tech AI	92

Created by Chhatrapati Supare

Loding using fetch()

Result

The JSON student data was successfully loaded using both **JavaScript fetch()** and **jQuery \$.getJSON()**. The retrieved data was dynamically rendered in an HTML table containing **ID, Name, Course, and Marks**.

The application successfully displayed the student records and demonstrated two different techniques for retrieving and processing JSON data.

Output: The student data was displayed dynamically in the table as shown in the output screenshots.

Loding using get.JSON()

Conclusion

Thus, the experiment successfully demonstrated how to **load and display JSON data using JavaScript fetch() and jQuery \$.getJSON()**. The retrieved JSON records were dynamically inserted into an HTML table using JavaScript DOM manipulation.

This experiment provides a practical understanding of **JSON data handling, asynchronous requests, fetch(), jQuery AJAX methods, and dynamic HTML table generation**.
